Summary

As a growth-oriented Software Engineering student, I place continuous learning and meaningful value creation at the center of my work. I view every challenge as a learning opportunity, aiming to create lasting and sustainable solutions by combining individual discipline with a strong team spirit. Driven by the power of diligent work and adding value to my environment, I embrace taking responsibility and exceeding my potential as a core principle in every project.

Education

Software Engineering

2023-2027

Firat University

Faculty of Technology - 4rd Student

Experience

ERP Intern — Lila Cosmetics

- During my 40-business-day summer internship, I actively participated in software development processes and gained hands-on experience in desktop application development using C#, .NET Windows Forms, DevExpress, SQL Server, and LINQ to SQL. I developed an automation system designed to manage operational processes in manufacturing facilities, working on modules such as inventory and warehouse management, production tracking, procurement, quality control, recipe management, and user authorization. I also gained practical experience in database design, user interface development, business rule implementation, debugging, and version control with Git/GitHub.

Projects

Human Resources Management System (HRMS)

- A web-based system designed to digitalize human resources processes such as employee management, leave tracking, payroll, and performance evaluation. Developed using **C# (.NET Framework)**, **SQLite**, and **DevExpress** technologies.

Used Books Sales Platform

- A web application that enables users to easily sell and purchase used books. Developed with **Node.js**, **MongoDB**, and **Cursor AI**, featuring intelligent recommendation and dynamic product management modules.
- Zirve — Nature Sports Volunteering Platform
- A full-stack platform connecting volunteers with organizations. Features include an event application system, club profile pages, a badge/gamification mechanism, and an event discovery feed.
- The backend was built with **FastAPI** and **PostgreSQL** as an asynchronous REST API; authentication is handled via JWT, and database management is structured with **SQLAlchemy** and **Alembic**. The web interface was developed using **Next.js** and **Tailwind CSS**, with state management handled by TanStack Query and Zustand. A native iOS application was also built in **Swift / SwiftUI** following the **MVVM** architecture.

Manufacturing Production & Process Management System

- A desktop automation system developed to centrally manage the operational processes of various manufacturing facilities. The system integrates inventory and warehouse management, recipe management, production planning and tracking, procurement, quality control, R&D, and user authorization processes.
- The system supports the complete production lifecycle, including production order creation, material reservation, inventory movements, quality control processes, and finished goods stock entries. Developed using **C#**, **.NET**, **DevExpress**, SQL Server, and **LINQ to SQL**.

Sertificates

YetGen – 21st Century Awareness Education Program

- Completed a training program focused on career planning, leadership, presentation skills, and algorithmic thinking, reinforced through teamwork and group meetings.

Habitat Association – Yarını Kodlayanlar Project | Python Programming

- Completed training on the fundamentals of Python programming, including variables, data types, conditional statements, loops, functions, and fundamental data structures. Strengthened algorithmic thinking and problem-solving skills through practical exercises.
